/done libe-"Human Retinal pigment epithelium/choroid cDNA (Un-normalized, unamplified): cs"
/note="Organ: Eye; Vector: pCMVSPORT6; Two different donor eyes (75-80 years old) yielded approximately 600 mg of dissected RPE/choroid tissue. This in turn yielded 340 ug of total RNA and 7 ug of mRNA. A directionally cloned cDNA library in the pCMVSPORT6 vector was constructed at Life rechnologies (Rockville, MD; now part of Invitrogen Corp, essentially following the protocols of the SuperScript Plasmid System (Invitrogen Corp, Plasmid System (Invitrogen Corp, Plasmid System (Invitrogen.Corp, The library code designation was cs. For this library, cDNA inserts were cloned into the Not!/Mull sites of the vector. EST analysis was performed on the unamplified library at the NHH Intramural Sequencing Center (NISC)."

synthesis was primed with an oligo-dr primer cont
Not I site. Double stranded cDNA was ligated to a
adaptor, digested with Not I, and cloned directic
into pryrab-Pac vector. The oligonucleotide used t
the synthesis of first-strand cDNA contains a lit
sequence that is located between the Not I site a
(GT)18 tail. The sequence tag for this library is
TGATCACGCT.

/clone lib="NIH MGC 214"
/note="Corgan: Lung; Vector: prx-Asc; Site 1: EcoR Site 2: Not 1; The library was constructed according nonaldo, Lennon and Soares, Genome Research, 6:791 1996. Denatured RNA was size fractionated on a 1% gel. First strand cDNA synthesis was primed with c primer containing a Not I site. Double strand cDNA size selected according to mRNA size fraction, lig with EcoR I adaptor, digested with Not I and then directionally into prx-Asc vector. The library tag sequence located between the Not I site and the po is GATAAGGCCA. Tissue was provided by Mary Hendrix
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Eutelec Mammalia; Eutheria, Primates, Catarrhini, Hominidae, Homo. 1 (bases 1 to 666)

/not_CGAP_FT2 is a subtracted cDNA library constructed a pool of 81 RNA samples from Alveolar Macrophages challenged with different treatments. The library was subtracted according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. The tissue was provided by Dr. Gary W. Hunninghake of the University of Iowa.

/clone lib="NIH MGC 214"
/clone lib="Organ: Lung; Vector: pYX-Asc; Site 1: EcoR I;
/site 2: Not I; The library was constructed according
Bonaldo, Lennon and Soares, Genome Research, 6:791-806,
1996. Denatured RNA was size fractionated on a it agarose
gel: First strand cDNA synthesis was primed with oligo-dr
primer containing a Not I site. Double strand cDNA was
size selected according to mRNA size fraction, ligated
with EcoR I adaptor, digested with Not I and then cloned
directionally into pYX-Asc vector. The library tag
sequence located between the Not I site and the polyA tail
is GATAAGGCCA. Tissue was provided by Mary Hendrix."

/lab nost="Data" buttle leconologies; /lab nost="Data" conditions libe"NGI CGAP FEL. // (lone libe") condition of polylinker; Site_1: EC Site_2: Not I; NGI CGAP FEEL is a normalized cDNA lero; defrom a pool of mRNA obtained from 3 cell lrom grade II chondrosarcoma tissues. The library constructed according to Bonaldo, Lennon and Soare Genome Research, 6:791-806, 1996. First strand cDN synthesis was primed with an oligo-dr primer contex Not I site. Double stranded cDNA was ligated to adaptor, digested with Not I, and cloned direction into pT773-per vector. The oligonucleotide used to the synthesis of first-strand cDNA contains a libr sequence that is located between the Not I site at (dT) at all the sequence that is located between the Not I site at (GT) at all the sequence this library is CGTACGACGAC. The cell lines were provided by Dr Jan Martin from the University of lowa.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         выемения linear EST 04-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Email: Cgapbs-r@mail.nib.gov
The sequence contained an oligo-dr track that was present oligonucleotide that was used to prime the synthesis of fin strand cDNA and therefore this may represent a bonafide potatin. CDNA Library Preparation: M.B. Soares Lab Clone distinct CGAP Clone distribution information can be found throw I.M.A.G.E. Consortium/LIML and information can be found throw www-bio.llni.gov/bbrp/image/image.html The following repetielements were found in this cDNA sequence: 49-81,

Plasmid DNA from the normalized library NCI CGAP Kid3 was
prepared, and se circles were made in vitro. Following HAP
purification, this DNA was used as tracer in a subtractive
hybridization reaction. The driver was PCR-amplified cDNAs
from a pool of 5,000 clones made from the same library
(cloneIDs 1322376-1323911, 1456007-1456775, and
1500552-1502055). Subtraction by Bento Soares and M.
Fatima Bonaldo. "

```
Site 2: Sall; Starting library constructed using SuperScript Plasmid Library kit (Life Technologies). CDNA made by oligo-dT priming. Size-selected by column fractionation, average insert size 1.08 kb. Library was amplified once on solid support and plasmid DNA from library was prepared. The library DNA was normalized by method #4 from Bonaldo, Lennon, and Soares 1996 Genome Research 6:791-806; 0.5 microgram single-stranded library plasmid DNA was mixed with 5 micrograms PCR product representing library inserts and hybridized to an Ecot of 20. Single-stranded (unhybridized) plasmids were isolated by hydroxyapatite chromatography and used to make this library."

with a modified polylinker; Plaamid DNA from the
normalized library NCI CGAP Pr22 was prepared, and ss
circles were made in vitro. Following HAP purification,
this DNA was used as tracer in a subtractive hybridization
this DNA was used as tracer in a subtractive hybridization
caction. The driver was PCR-amplified cDNAs from a pool
of 5,000 clones from the same library (cloneIDs
985608-986759, 1101192-11101959, and 1217928-1220615).
